General Knowledge Quiz

1. What are the TWO free energies that run my farm?

Sunlight

Gravity

2. How do I assess my basic farm productivity?

The total **GREEN SURFACE AREA** of my farming system i.e.,

Which translates as the conversion of Sunlight energy into Organic matter

Via the process of photosynthesis.

3. What is the purist and most readily available **WATER** for plants, on your farm?

Dew includes mists, fog, all commonly referred to as the **DAILY WATER CYCLE**.

4. Where does the energy that powers cyclones, typhoons and tornados, as well as, high and low pressure systems come from?

The energy released from the **Latent Heat** of Condensation,
when WATER changes of state from a gas to a liquid

5. How do landscape ecosystems
maintain their fertility (carbon) balance?

One way that nature does this is by growing edible and inedible plants together

6. Dryland Salinity. Does salt rise (against gravity)?

Or do you think it is moved laterally and
expressed at the surface?

The Water Cycle and Dryland Salinity

No. It can only move laterally to appear on the surface.

7. In Australia, are high water tables in farming systems beneficial to productive outcomes or detrimental?

Never, when managed correctly.

8. Can you name the 4 basic functions of plants?

1. solar powered **air conditioners**,
2. solar powered **pumps**, (reversing losses to gravity)
3. solar powered **processing factories**, and...
4. building soil carbon

1

2

3

4

9. Can you identify the natural, landscape progression
in ALL terrestrial ecosystems?

Put very simply, it is a progression from a **high** point to a **low** point. ie.,
from the Mountain to the sea and from Forestry to aquaculture (high to low)

10. Finally, what is the numerical value of the Carbon/Nitrogen ratio? And as a farmer, what is the significance of this ratio to farm productivity?

30:1

Why NSF (Natural Sequence Farming) & TPT (Tarwyn Park Training)

- All about water
- Plants not soil
- European Landscape Function
 - a) Freeze
 - b) Thaw
- Australian Landscape Function
 - a) Perched wetlands
 - b) Feedback loops

Failing Landscapes

Chicken Foot Erosion

Contouring-WHY?

Nature's way of contouring known as chain mailing

Contouring-WHY?

Chain Mailing in steeper country

Contouring-WHY?

The end result of a bank less contour

Contouring-WHY?

Bank less contour before and after rain.

Contouring-WHY?

Restoration of an eroded gully by using contouring

Before

After

Contouring-WHY?

Contour two weeks old then received 850mm in two & a half days

Filter The Flow Is a Must Know

Filter The Flow Is a Must Know

Farm Planning

When planning your farm you can split it into three main zones:

1. The Accumulation Zone- where nutrients are transported and trees are planted.
2. The Cropping Zone- consists of grazing, cropping or hay making
3. The Filtration Zone- consists of wetlands or wet areas

Old Mick Tjakamarra's Floodplain Dreaming for Children with Possum Story provides the traditional cultural intelligence and conceptual understanding employed by Peter Andrews in Australia for his natural sequence farming system implemented at Tarwyn Park and elsewhere. Refer Australia Story, On the Brink & Beyond the Brink ABC Books.
